1. Introduction

Introduction

The main propose of this document is to show a concise report about the activity of bees and behavior in a specific period of time. This report also shows a complete analysis of the most active hours.

This report corresponds to a period of time of 123 day(s). From 2016-07-02 to 2016-12-02. During this period of time, a total amount of 18653 lectures were registered from 156 different bees. There exist a total of 26 non-active days. We define an 'active day' if there is more than one observation. (see Figure 1.1).

Relation: Active VS Non-active Days

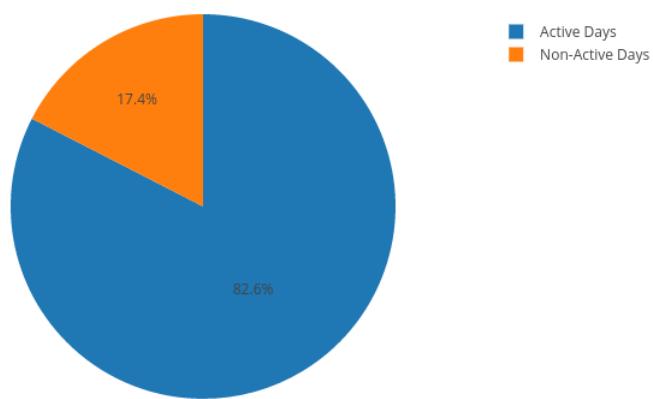

Figure 1.1: Days with and without Empty Reads

2. Analysis of Raw Data

Activity Per Day of Raw Data

This section addresses the analysis of raw data. Which implies that this date is presented without filters or a data preprocessing step to clean the data. This section presents several graphs which reflects the behavior of a beehive during a specific period of time.

3. Analysis of Clean Data

Activity Per Day of Clean Data

In this section is presented an analysis of input data. During this analysis some filters were applied. One of these filters is the definition of a threshold which removes all the observations that fall in a period of time less than 60 seconds. This preprocessing step tends to remove all the lost chips which generated unnecessary and repeated registers
